```
In [ ]: from Bio.Seq import Seq

dna = Seq("ATGGCGCGCTTA")
gc_content = (dna.count("G") + dna.count("C")) / len(dna) * 100
print("DNA Sequence:", dna)
print(f"GC Content: {round(gc_content, 2)}%")
```

DNA Sequence: ATGGCGCGCTTA

GC Content: 58.33%

Conclusion

The GC content of the target sequence was successfully calculated. The sequence exhibits a GC ratio of 58.33%, which reflects its thermal stability profile in DNA strands.
